Computer Graphics (CS 543)
# Lecture 2b: 2D Graphics Systems
(Drawing Polylines, tiling, & Aspect Ratio)

Prof Emmanuel Agu

Computer Science Dept.

*Worcester Polytechnic Institute (WPI)*

Announcements

- All code from book (working programs) on book website.
  - Quite useful. Take a look
    - https://www.cs.unm.edu/~angel/BOOK/INTERACTIVE_COMPUTER_GRAPHICS/SIXTH_EDITION/CODE/

Screen Coordinate System

- Screen: 2D coordinate system (WxH)

- 2D Cartesian Grid

- Origin (0,0): lower left corner (OpenGL convention)

- Horizontal axis – x

- Vertical axis – y

- Pixel positions: grid (x,y) intersections

(0,0)

(2,2)

y

x
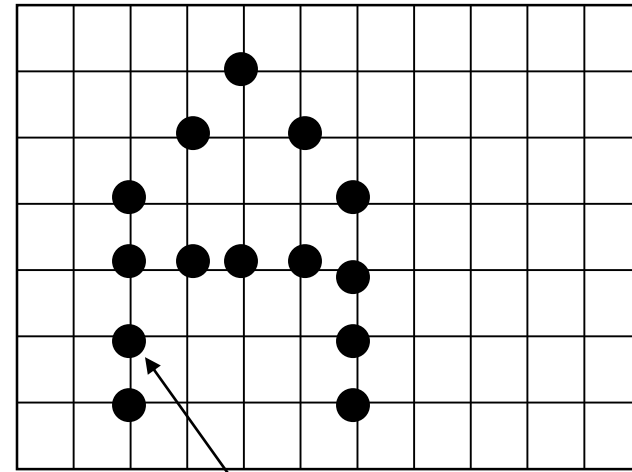

Screen Coordinate System

(0,0) is lower left corner of **OpenGL Window.**
NOT lower left corner of entire desktop
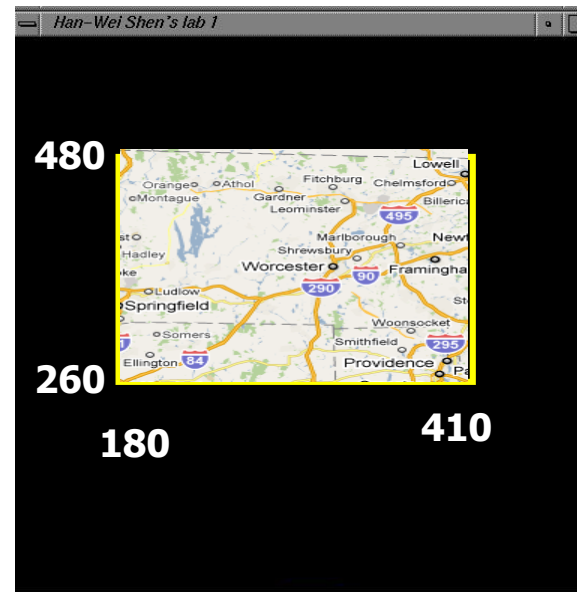

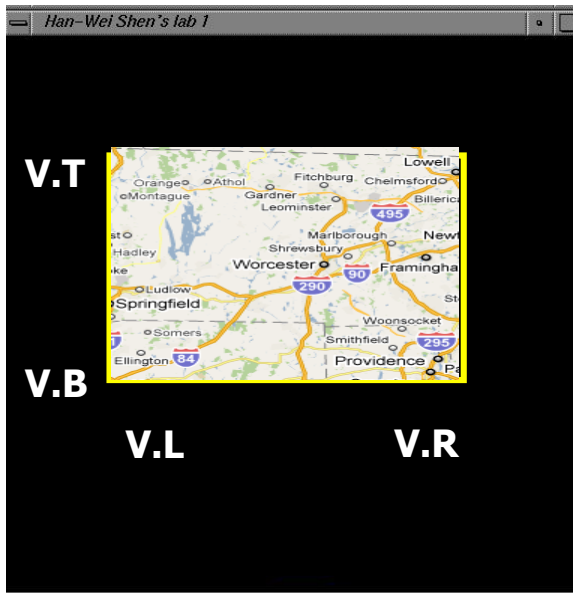

OpenGL's (0,0)

Defining a Viewport

- Can draw to any rectangle (sub-area of screen)
- **Viewport:** Area of screen we want to draw to
- To define viewport

  `glViewport(left, bottom, width, height)`

  `or glViewport(V.L, V.B, V.R – V.L, V.T – V.B)`

  `e.g. glViewport(180, 260, (410 – 180), (480 – 260) )`

Recall: OpenGL Skeleton

```
void main(int argc, char** argv){
    // First initialize toolkit, set display mode and create window
    glutInit(&argc, argv);    // initialize toolkit
    glutInitDisplayMode(GLUT_SINGLE | GLUT_RGB);
    glutInitWindowSize(640, 480);
    glutInitWindowPosition(100, 150);
    glutCreateWindow("my first attempt");
    glewInit( );

    // ... now register callback functions
    glutDisplayFunc(myDisplay);
    glutReshapeFunc(myReshape);
    glutMouseFunc(myMouse);
    glutKeyboardFunc(myKeyboard);

    myInit( );
    glutMainLoop( );
}
```

OpenGL Demo
Controls: Mouse, Cursor, Space, F1, F2, F3   by David Jorge Aguirre Grazio

```
void mydisplay(void){
    glClear(GL_COLOR_BUFFER_BIT);
    glDrawArrays(GL_LINE_LOOP, 0, 3);
    glFlush( );
}
```

Note: default viewport is entire created window

Example: Changing Viewport

How to change viewport to:

    Bottom left corner at (100,80)

   Width changes to 700, height changes to 300??

```
void main(int argc, char** argv){
    // First initialize toolkit, set display mode and create window
    glutInit(&argc, argv);    // initialize toolkit
    glutInitDisplayMode(GLUT_SINGLE | GLUT_RGB);
    glutInitWindowSize(640, 480);
    glutInitWindowPosition(100, 150);
    glutCreateWindow("my first attempt");
    glewInit( );

    // ... now register callback functions
    glutDisplayFunc(myDisplay);
    glutReshapeFunc(myReshape);
    glutMouseFunc(myMouse);
    glutKeyboardFunc(myKeyboard);

    myInit( );
    glutMainLoop( );
```

```
void mydisplay(void){
    glClear(GL_COLOR_BUFFER_BIT);
    glViewport(100,80,700,300);
    glDrawArrays(GL_LINE_LOOP, 0, 3);
    glFlush( );
}
```
Note: Set desired viewport, then draw

Tiling: Changing Viewport in a Loop

- **Problem:** Want to tile Triangle file on screen
- Solution: change viewport in loop, draw tiles

One world triangle

Multiple tiled viewports

Tiling Triangle Code Snippet

- Set viewport, draw into tile in a loop
- Code snippet to draw 6x6 tiles:

```
float w, h;

w = width / 6;
h = height / 6;

for (int k=0; k<6; k++) {
        for (int m=0; m<6; m++) {
                glViewport(k * w, m * h, w, h);
                glDrawArrays(GL_LINE_LOOP, 0, NumPoints);
        }
}
```
Example: Tiling, Changing Viewport

```
void main(int argc, char** argv){
    // First initialize toolkit, set display mode and create window
    glutInit(&argc, argv);    // initialize toolkit
    glutInitDisplayMode(GLUT_SINGLE | GLUT_RGB);
    glutInitWindowSize(640, 480);
    glutInitWindowPosition(100, 150);
    glutCreateWindow("my first attempt");
    glewInit( );

    // ... now register callback functions
    glutDisplayFunc(myDisplay);
    glutReshapeFunc(myReshape);
    glutMouseFunc(myMouse);
    glutKeyboardFunc(myKeyboard);

    myInit( );
    glutMainLoop( );
}
```

```
void mydisplay(void){
    glClear(GL_COLOR_BUFFER_BIT);
    float w, h;

    w = width / 6; h = height / 6;

    for (int k=0; k<6; k++) {
        for (int m=0; m<6; m++) {
            glViewport(k * w, m * h, w, h);
            glDrawArrays(GL_LINE_LOOP, 0, NumPoints);
        }
    }
    glFlush( );
}
```
World Coordinate System

- Problems with drawing in screen coordinates:
  - **(x,y) dimensions in pixels:** one mapping, inflexible
  - Not application-specific
- **World coordinate:** application-specific
- E.g: Same screen area. Change input drawing (x,y) range

Change World window (mapping)

100 pixels = 30 miles

100 pixels = 0.25 miles

Using Window Coordinates

- Would like to:
  - Specify **source** boundaries (extents) of original drawing in world coordinates (miles, meters, etc)
  - Display **target region** in screen coordinates (pixels)
- Programming steps:
  1. Define world window (original drawing extents)
  2. Define viewport (drawing extents on screen)
  3. Map drawings within window to viewport
- Mapping called ***Window-to-viewport mapping!***

World Coordinate System

- **World Window:** region of **source** drawing to be rendered
- Rectangle specified by world window is drawn to screen
- Defined by (left, right, bottom, top) or (*W.L, W.R, W.B, W.T)*
Defining World Window

- `mat4 ortho` **= Ortho2D`(left, right, bottom, top)`**

`Or mat4 ortho` **= Ortho2D`(W.L, W.R, W.B, W.T)`**

- **Ortho2D** generates 4x4 matrix that scales input drawing
- **Note:** Need to include **mat.h** (contains **Ortho2D**)
Drawing

- After setting world window (using ortho2D) and viewport (using glviewport),
  - Draw as usual with **glDrawArrays**

Apply ortho( ) matrix in Vertex Shader

- **One more detail:** Need to pass ortho matrix to shader
- Multiply each vertex by ortho matrix to scale input drawing
- Need to connect **ortho** matrix to **proj** variable in shader

```
mat4 ortho = Ortho2D( W.L, W.R, W.B, W.T );
```

Call Ortho2D in Main .cpp file

```
uniform mat4 Proj;
in vec4 vPosition;

void main( ){
    gl_Position = Proj * vPosition;

}
```

In vertex shader, multiply each vertex with **proj** matrix

Apply ortho( ) matrix in Vertex Shader

1. Include mat.h from book website (ortho2D declared in mat.h)

```
#include "mat.h"
```

2. Connect **ortho** matrix to **proj** variable in shader

```
mat4 ortho = Ortho2D( W.L, W.R, W.B, W.T );

ProjLoc = glGetUniformLocation( program, "Proj" );
glUniformMatrix4fv( ProjLoc, 1, GL_TRUE, ortho );
```

Call Ortho2D in Main .cpp file
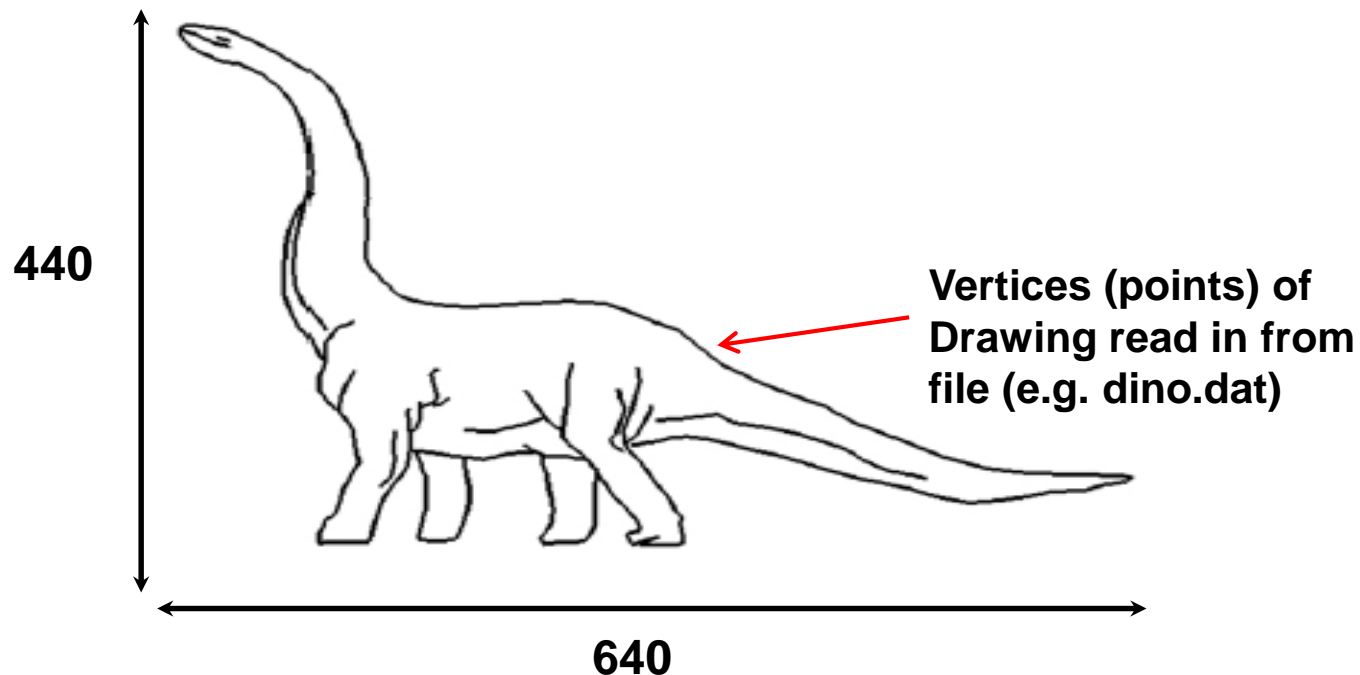

```
uniform mat4 Proj;

in vec4 vPosition;

void main( ){

    gl_Position = Proj * vPosition;

}
```

In shader, multiply each vertex with **proj** matrix

Drawing Polyline Files

- May read in list of vertices defining a drawing
- **Problem:** want to draw single dino.dat on screen
- **Note:** size of input drawing may vary

440

640

Vertices (points) of Drawing read in from file (e.g. dino.dat)

Drawing Polyline Files
- **Problem:** want to draw single dino.dat on screen

- pseudocode snippet:

```
// set world window (left, right, bottom, top)
ortho = Ortho2D(0, 640.0, 0, 440.0);

//….. Pass ortho to vertex shader… then…

//  now set viewport (left, bottom, width, height)
  glViewport(0, 0, 64, 44);

// Draw polyline fine
  drawPolylineFile(dino.dat);
```
Question: What if I wanted to
draw the bottom quadrant of polyline?

440

640

Tiling using W-to-V Mapping

- **Problem:** Want to tile polyline file on screen
- Solution: W-to-V in loop, adjacent tiled viewports

One world Window

a)

Multiple tiled viewports

Tiling Polyline Files

- Problem: want to tile dino.dat in 5x5 across screen
- Code snippet:

```
// set world window
ortho = Ortho2D(0, 640.0, 0, 440.0);

//….. Pass ortho to vertex shader… then…

for(int i=0;i < 5;i++)
{
  for(int j = 0;j < 5; j++)
  {   // .. now set viewport in a loop
      glViewport(i * 64, j * 44; 64, 44);
      drawPolylineFile(dino.dat);
  }
}
```
Maintaining Aspect Ratios

- Aspect ratio **R** = Width/Height
- What if window and viewport have different aspect ratios?
- Two possible cases:

Case a: viewport too wide

Case b: viewport too tall
What if Window and Viewport have different Aspect Ratios?

- **R** = window aspect ratio, **W x H** = viewport dimensions
- Two possible cases:
  - **Case A (R > W/H):** map window to tall viewport?

Viewport

Aspect ratio **R**

Window

W/R

H

W
```
ortho = Ortho2D(left, right, bottom, top );
R = (right − left)/(top − bottom);
If(R > W/H)
            glViewport(0, 0, W, W/R);
```

What if Window and Viewport have different Aspect Ratios?

- **Case B (R < W/H):** map window to wide viewport?

Aspect ratio **R**

Window

W

H

HR
Viewport

```
ortho = Ortho2D(left, right, bottom, top );
R = (right – left)/(top – bottom);
If(R < W/H)
            glViewport(0, 0, H*R, H);
```

reshape( ) function that maintains aspect ratio

```
// Ortho2D(left, right, bottom, top )is done previously,
// probably in your draw function
// function assumes variables left, right, top and bottom
// are declared and updated globally

void myReshape(double W, double H ){
   R = (right – left)/(top – bottom);

   if(R > W/H)          // tall viewport
        glViewport(0, 0, W, W/R);
   else if(R < W/H)    // wide viewport
        glViewport(0, 0, H*R, H);
   else
        glViewport(0, 0, W, H);  // equal aspect ratios
}
```

Interaction

Adding Interaction

- So far, OpenGL programs just render images

- Can add user interaction

- Examples:

  - User hits 'h' on keyboard -> Program draws house

  - User clicks mouse left button -> Program draws table

Types of Input Devices

- **String:** produces string of characters e.g. keyboard

- **Locator:** User points to position on display. E.g mouse

Types of Input Devices

- **Valuator:** generates number between 0 and 1.0 (proportional to how much it is turned)
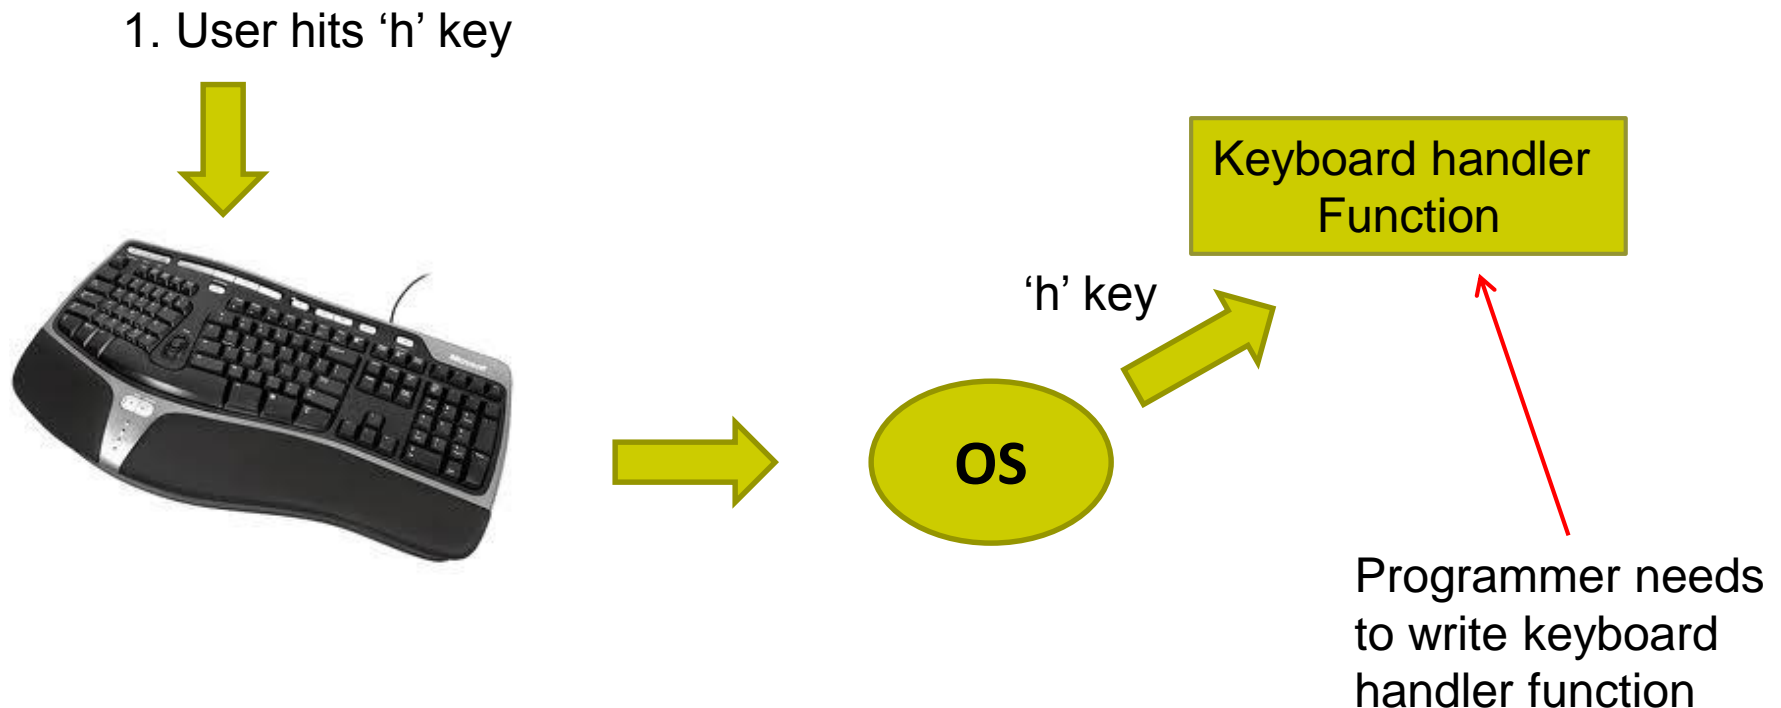

- **Pick:** User selects location on screen (e.g. touch screen in restaurant, ATM)

GLUT: How keyboard Interaction Works

- Example: User hits 'h' on keyboard -> Program draws house

1. User hits 'h' key

Keyboard handler Function

'h' key

OS

Programmer needs to write keyboard handler function

Using Keyboard Callback for Interaction

```
void main(int argc, char** argv){
    // First initialize toolkit, set display mode and create window
    glutInit(&argc, argv);    // initialize toolkit
    glutInitDisplayMode(GLUT_SINGLE | GLUT_RGB);
    glutInitWindowSize(640, 480);
    glutInitWindowPosition(100, 150);
    glutCreateWindow("my first attempt");
    glewInit( );

    // … now register callback functions
    glutDisplayFunc(myDisplay);
    glutReshapeFunc(myReshape);
    glutMouseFunc(myMouse);
    glutKeyboardFunc(myKeyboard);

    myInit( );
    glutMainLoop( );
}
```

1. Register keyboard Function

2. Implement keyboard function

ASCII character of pressed key

x,y location of mouse

```
void myKeyboard(char key, int x, int y )
{    // put keyboard stuff here
    ……….
    switch(key){    // check which key
        case 'f':
            // do stuff
        break;

        case 'k':
            // do other stuff
        break;

    }
    ……………
    }
```

Note: Backspace, delete, escape keys checked using their ASCII codes

# Special Keys: Function, Arrow, etc

```
glutSpecialFunc (specialKeyFcn);
......
Void specialKeyFcn (Glint specialKey, GLint, xMouse,
                                    Glint yMouse)
```

- Example: if (**specialKey == GLUT_KEY_F1)** // F1 key pressed
  - **GLUT_KEY_F1, GLUT_KEY_F12,** …. for function keys
  - **GLUT_KEY_UP, GLUT_KEY_RIGHT,** …. for arrow keys keys
  - **GLUT_KEY_PAGE_DOWN, GLUT_KEY_HOME,** …. for page up, home keys
- Complete list of special keys designated in **glut.h**
GLUT: How Mouse Interaction Works

- Example: User clicks on (x,y) location in drawing window -> Program draws a line

1. User clicks on (x,y) location

Mouse handler Function

OS

Programmer needs to write keyboard handler function

Using Mouse Callback for Interaction

```
void main(int argc, char** argv){
    // First initialize toolkit, set display mode and create window
    glutInit(&argc, argv);    // initialize toolkit
    glutInitDisplayMode(GLUT_SINGLE | GLUT_RGB);
    glutInitWindowSize(640, 480);
    glutInitWindowPosition(100, 150);
    glutCreateWindow("my first attempt");
    glewInit( );

    // … now register callback functions
    glutDisplayFunc(myDisplay);
    glutReshapeFunc(myReshape);
    glutMouseFunc(myMouse);
    glutKeyboardFunc(myKeyboard);

    myInit( );
    glutMainLoop( );
}
```

2. Implement mouse function

```
void myMouse(int button, int state, int
   x, int y)
{     // put mouse stuff here

   ……………
   }
```

**1. Register keyboard Function**

# Mouse Interaction

- Declare prototype
  - `myMouse(int button, int state, int x, int y)`
  - `myMovedMouse`
- Register callbacks:
  - `glutMouseFunc(myMouse):` mouse button pressed
  - `glutMotionFunc(myMovedMouse):` mouse moves with button pressed
  - `glutPassiveMotionFunc(myMovedMouse):` mouse moves with no buttons pressed
- Button returned values:
  - GLUT_LEFT_BUTTON, GLUT_MIDDLE_BUTTON, GLUT_RIGHT_BUTTON
- State returned values:
  - GLUT_UP, GLUT_DOWN
- X,Y returned values:
  - x,y coordinates of mouse location

# Mouse Interaction Example

- **Example:** draw (or select ) rectangle on screen
- Each mouse click generates separate events
- Store click points in **global** or **static** variable in mouse function

**GLUT (0,0)**

**ScreenHeight**
**OpenGL (0,0)**
```
void myMouse(int button, int state, int x, int y)
{
    static GLintPoint corner[2];
    static int numCorners = 0;   // initial value is 0
    if(button == GLUT_LEFT_BUTTON && state == GLUT_DOWN)
    {
        corner[numCorners].x = x;
        corner[numCorners].y = screenHeight – y; //flip y coord
        numCorners++;
```

Screenheight is height of drawing window

Mouse Interaction Example (continued)

Corner[1]

4	**3**
1	**2**

Corner[0]

```
if(numCorners == 2)
{
    // draw rectangle or do whatever you planned to do
    Point3 points[4] = corner[0].x, corner[0].y,    //1
                       corner[1].x, corner[0].y,    //2
                       corner[1].x, corner[1].y,    //3
                        corner[0].x, corner[1].y);  //4

     glDrawArrays(GL_QUADS, 0, 4);

     numCorners == 0;
}
else if(button == GLUT_RIGHT_BUTTON && state == GLUT_DOWN)
    glClear(GL_COLOR_BUFFER_BIT); // clear the window
glFlush( );
}
```
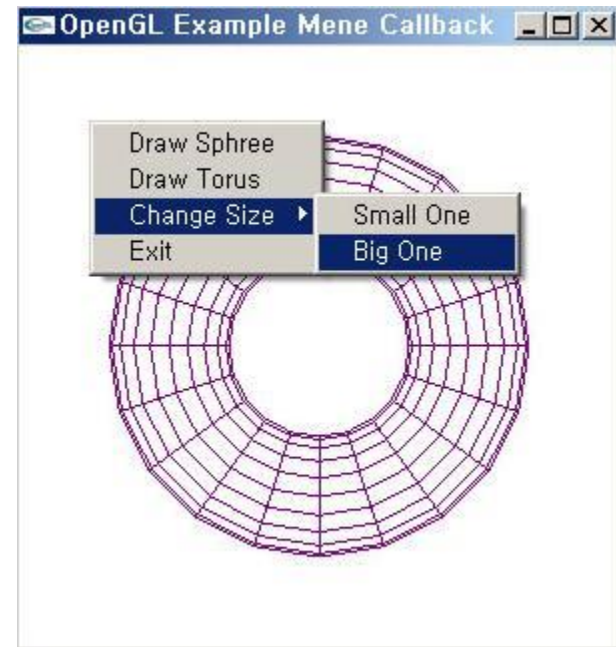

Menus

- Adding menu that pops up on mouse click

  1. Create menu using `glutCreateMenu(myMenu);`

  2. Use `glutAddMenuEntry` adds entries to menu

  3. Attach menu to mouse button
     (left, right, middle) using
   `glutAttachMenu`

Menus

- Example:

Shows on menu

Checked in mymenu

```
glutCreateMenu(myMenu);
 glutAddMenuEntry("Clear Screen", 1);
 glutAddMenuEntry("Exit", 2);
 glutAttachMenu(GLUT_RIGHT_BUTTON);
```

| Clear Screen | 1 |
| Exit | 2 |

```
 ….

 void mymenu(int value){
    if(value == 1){
        glClear(GL_COLOR_BUFFER_BIT);
        glFlush( );
    }
    if (value == 2) exit(0);
 }
```

GLUT Interaction using other input devices

- Tablet functions (mouse cursor must be in display window)

  ```
  glutTabletButton (tabletFcn);
  …..
  void tabletFcn(Glint tabletButton, Glint action, Glint
      xTablet, Glint yTablet)
  ```

- Spaceball functions
- Dial functions
- Picking functions: use your finger
- Menu functions: minimal pop-up windows within your drawing window
